

### ***She is biologist ...***

*« As a biologist, I am particularly interested in understanding mechanism of diseases in order to develop therapies.*

*Biology refers to the integration of the different levels of understanding of the living: from the very small, such as cells, to the very large such as the whole organism.*

*By analogy, my work reminds me that all things are connected. Bridging these different levels underscore the relationship between the microcosm and the macrocosm.*

*There is no truth in science, only realities that are validated in a system. This is similar to Freemasonry where dogma does not exist.*

*Freemasonry taught me to be more patient and understand that people move at different pace, although sometimes, I have to be in "mental" order to remind this to myself. »*
